

Hackathon Maestro Open

To become the biggest school in the world, we need a product anyone, anywhere, on any device can use.

Your mission: build an **OPEN** version of Maestro that reaches as many users as possible — at **\$0 COGS** (or close to it).

▼ Goals

- ▼ End to end product experience
- ▼ COGS: \$0 (or close to it)
- ▼ At scale
- ▼ Engaging

▼ Brief

Your mission — Build an open version of Maestro, end to end, that reaches as many users as possible at \$0 cost per user (or close to it). A real product someone can open, learn from, and come back to. Not a feature, not a demo — a whole thing that works on its own.

Build a product people love — You know Maestro from the inside — what works, what doesn't. Start simple, then iterate. The bar: enjoyable, efficient, and \$0 COGS (that last one is the real challenge).

The one rule — It can't cost us money when a new user shows up. No cloud LLM bill per lesson, no per-user server. The model runs on the user's own device — that's what makes it free to scale.

Tools you can use:

- Maestro's lesson structure — use the existing lesson format from Maestro/LMS; don't invent your own content model.

- web-llm (github.com/mlc-ai/web-llm) — the tutor runs on the user's own hardware, no server inference.

Everything else is up to you — What you build and how it reaches people is your call. Build it end to end. A simple product that fully works beats a pile of half-features.

Format — Solo. You build it, you own it, you demo it.

What you show at the end — A working product someone can use today, and a 10-minute presentation of what you built.

▼ Dataset

Maestro doesn't just need to give correct answers — it needs to *teach well*, and we've mapped 10 real scenarios where it tends to slip/wrong. You're asked to make sure Maestro handles each of these 10 scenarios correctly — getting both the answer *and* the teaching right.
